

One platform for your network's *core*.

Themelio is a modern, self-hosted DDI platform that brings DNS, DHCP and IP Address Management together in a single console — reliable, secure and centralized, and owned by you rather than rented back to you.

Themelio console — System Overview: live query & lease rates, alerts, zone and pool health at a glance.

VISION

Network services that just work

A network whose foundation runs itself — where DNS, DHCP and IPAM behave as one system, stay consistent by design, and give a small team full control and visibility from a single screen. No spreadsheets, no silos, no surprises.

WHY IT MATTERS

Everything depends on this layer

Every login, application and device relies on DNS, DHCP and IPAM. When they fail or drift, the whole network feels it. Growing organizations simply can't afford a foundation that is fragmented, opaque, and billed by the query.

THE CHALLENGE

Core services, pulled apart

In most organizations DNS, DHCP and IPAM are run as three disconnected tools — or rented as metered cloud appliances. The result is manual work, configuration drift, address conflicts, no single source of truth, and cost that climbs as the network grows.

Three services, one platform, owned by you

Themelio integrates DNS, DHCP and IPAM into one management platform, simplifying administration, improving operational efficiency and reducing the complexity of managing IP infrastructure — with centralized visibility, automation and consistent policy across the whole organization.

Single console for DNS · DHCP · IPAM

One source of truth

Role-based administration

Comprehensive audit logging

RESTful API & automation

Secure by design

Runs inside your network

Scales as you grow

Core services — manage DNS, DHCP and IPAM from one place; stage changes, then Deploy with validation and automatic rollback.

HOW IT WORKS

From install to serving, in four steps

Themelio deploys as a single software package and is managed entirely from one console — no appliances, no cloud dependency, no internet connection required.

- 1 Deploy the platform.** Install a single, self-contained package — as one standalone node for a site, or as a managed grid across many sites. It runs entirely inside your own network.
- 2 Bring nodes online.** Each node joins the central Manager over a secure, outbound-only connection — no inbound ports to expose, ideal for tightly controlled networks.
- 3 Manage from one console.** Create zones, subnets and reservations; IPAM keeps every IP linked to its DNS record, lease, MAC and owner as a single source of truth.
- 4 Stage & deploy safely.** Group changes, validate them automatically, and apply together — with automatic rollback and a full audit trail of who changed what, and when.

KEY BENEFITS

Less complexity, more control

Unified & consistent

DNS, DHCP and IPAM in one console — a single source of truth that eliminates spreadsheets and address conflicts.

Fewer errors

Validation before every change, with automatic rollback, minimizes misconfiguration and downtime.

Run it with a small team

Centralized visibility and automation streamline routine work so a lean team can operate confidently.

Audit-ready

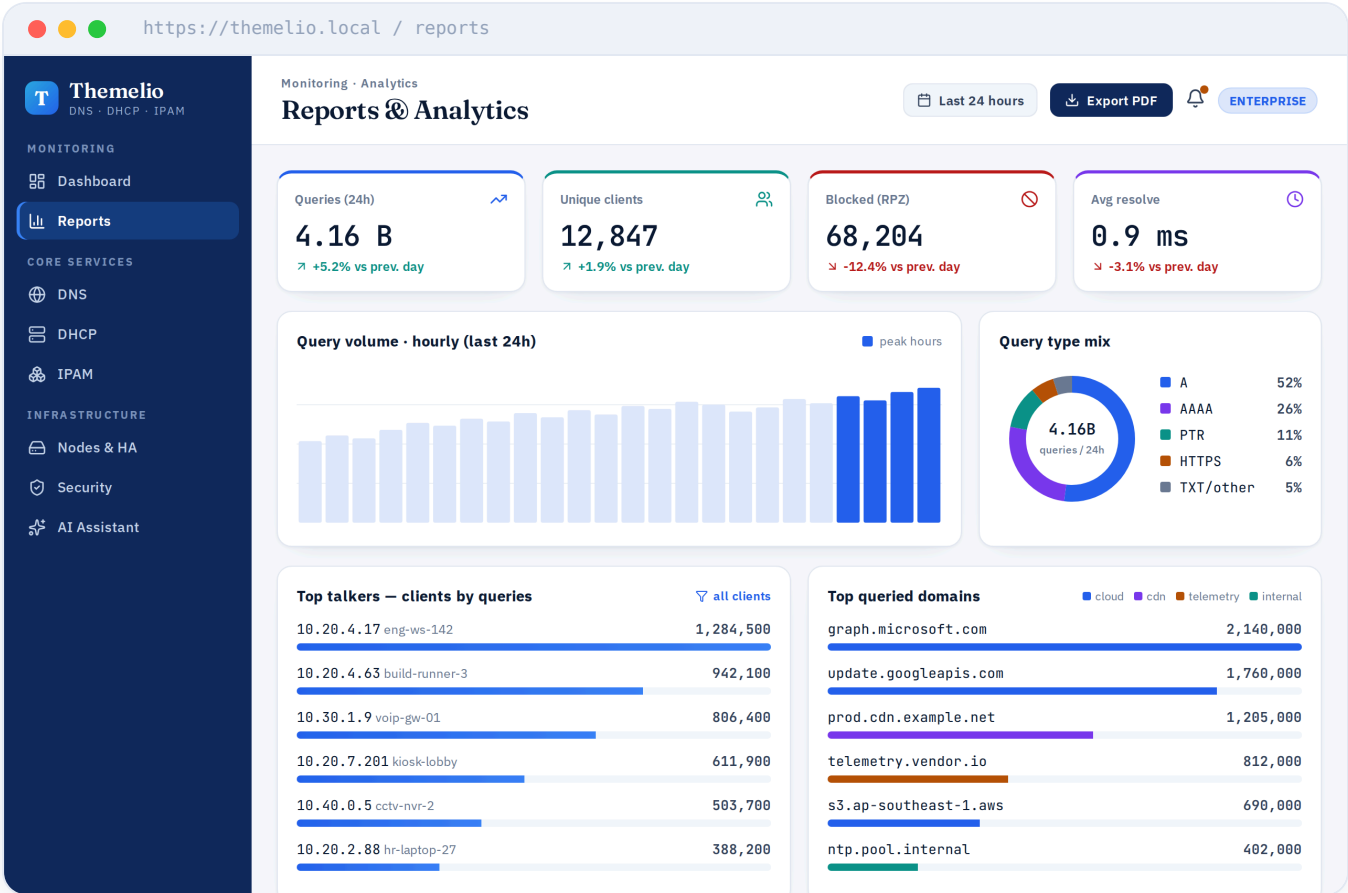

Role-based access, detailed event logging and scheduled reports turn daily operations into evidence.

Secure & sovereign

Secure DNS operations, granular controls, and data that never leaves your perimeter.

Owned & scalable

Perpetual licensing and node-based scaling grow with you — without traditional DDI overhead.

Reports & Analytics — query and lease insight, top talkers, and scheduled compliance, audit and security reports, exportable to PDF / CSV.

OUTCOME

A dependable foundation for a growing network

With Themelio, network teams get a DDI foundation that simplifies management while delivering the performance, visibility and reliability modern organizations require — across enterprise branches, campus networks and data centers. Less complexity, lower risk, predictable cost — and full ownership of your network's core.
